

A NEW LINE.
A NEW STANDARD.

AIR
SENTRY®

*The gold standard in
contamination control*

Introducing the new GUARDIAN™ line of breathers.

Air Sentry® set the industry gold standard with our first line of contamination control breathers in 1997 and today that standard is raised with the introduction of GUARDIAN™.

Air Sentry® was the first to integrate check valve technology into a desiccant breather. Being the first to offer replacement cartridges was another significant stride in reducing replacement costs for customers.

And we were the first to use two particle filters. There is a two micron filter at both ends of the breather.

Now, GUARDIAN™ takes check valve technology and cost-saving replacement measures to the next level. Air Sentry® introduces four more exclusive advancements that will again raise the bar in contamination control:

Integrated Compound Vacuum/Pressure Gauge

This proprietary feature is a true-life accurate indicator of filter conditions.

Tritan™ Construction

GUARDIAN™ is the first breather ever constructed of Tritan.™ This patented material is the most chemical-, temperature-, and impact-resistant combination casing on the market.

Stackable

Stack cartridges to extend the life of breathers even further using the Modular Stack Ring.™ This proprietary feature lengthens the service life, reducing cost and maintenance intervals.

Isolation Check Valve

GUARDIAN™ is first again with an isolation check valve, which isolates the adsorbent from exhaust air to lengthen service life of the desiccant while also protecting it from volatile and splashing fluids.

*The gold standard in
contamination control*
